# Publication 127 Component-in-Place Schedules 

## About this publication

Pub-127, Component-in-Place Schedules, is issued according to Section 8-5 of the Property Tax Code which states, "The Department shall confer with, advise and assist local assessment officers relative to the performance of their duties."

The cost schedules in this publication have been developed to help assessors estimate the replacement cost of commercial and industrial improvements. These components can be used in conjunction with structures valued using the Publication 126, Commercial and Industrial Cost Schedules. The assessor's professional judgement still greatly affects the outcome of this system.

The information in this publication is current as of the date of the publication. The contents of this publication are informational only and do not take the place of statutes, rules, or court decisions. For many topics covered in this publication, we have provided a reference to the Illinois Property Tax Code for further clarification or more detail at 35 ILCS 200/1 et seq.

January 2019

## Changes from previous editions:

Commercial and Industrial Structures are now valued by first selecting the appropriate structural shell and then selecting the current interior finish according to use and adding the two values together as described in Publication 126. The use of the structure is considered secondary to the structure type itself. There are 8 standard structural shell types and 39 typical interior finish schedules. There are dozens of specialty use interior finishes as well. Components can be added to and subtracted from the "typical" finish as needed. Structures of over 200,000 square feet can still be valued using the CIP schedules.
Features can be indexed both alphabetically and by schedule number.
The instructions and schedules for the valuation of Grain Elevators have been moved to the back of Publication 126.

## Acronyms used in this publication

| CF | Cubic Foot |
| :--- | :--- |
| CIP | Component-in-Place |
| FPM | Floors per Minute |
| GPD | Gallons per Day |
| GPM | Gallons per Minute |
| LB | Load Bearing |
| LF | Linear Foot |
| OC | On-center |
| SFCA | Square Foot Ceiling Area |
| SFDA | Square Foot Door Area |
| SFFA | Square Foot Floor or Square Foot Frame Area |
| SFGA | Square Foot Ground Area |
| SFRA | Square Foot Roof Area |
| SFSA | Square Foot Surface Area |
| SFWA | Square Foot Wall Area |
| VLF | Vertical Linear Foot |

Note: For definitions of common construction terms used in this Publication, see Publication 124, Construction Terminology.

## Structural Framing (Cost per SFFA)

Structural framing costs are provided below by correlation of an approximate frame bay area and the framing construction type. The derived costs are to be applied to all areas of a building that are structurally framed. Cost does not include truss or roof structure. Base prices are for 14 ' story height, add or deduct $5 \%$ for each foot of column height variation. This adjustment is to be made before entering the price in the computation ladder.

## Exterior Wall Coverings

This schedule starts with the wood or metal studs to which the cost of sheathing, insulation, etc., must be added. For build-up of the interior of the wall, see the interior wall finishes schedule to complete the wall cost.

| :---: | :---: | :---: |
| Normally, wall costs are priced for the total wall area when openings for doors, windows, etc. are only a small percentage of the total. The price of doors, windows, etc. is then added. When the openings represent over $20 \%$ of the total wall area, they should be deducted from the wall area before pricing the wall. For walls over 25 feet in height, add $1 \%$ for each foot. |  |  |

## 33 Heating-Ventilation-Air Conditioning (HVAC) <br> Per SFFA

Prices for HVAC are provided below according to finish or use of the building (or area within the building). The prices were developed on the basis of heating, ventilation or air conditioning cubic area and then converted to SF costs for the convenience of the assessor. Because of this, it may be necessary to adjust the costs for height. The base height is 14 ' and $3 \%$ of the cost indicated should be added or deducted for each foot of height variation in the subject building.

## Suspended Unit Heaters (Cost Each)

In those instances where a building has a very limited number of individual heating units, the above square foot cost might not be applicable. For a more reasonable cost estimate each individual heater should be priced separately. The costs are provided below and need not be adjusted for story height.

Fire Sprinkler System
Sprinkler costs include all interior heads, supply lines, and accessories. Wet system piping contains water at all times; dry pipe system contains air under pressure and is used in unheated areas where freezing might be encountered. For dry pipe systems, add $10 \%$ to the wet system prices. Pumps should be added to the costs below.

| $36 "$ | $\$ 890$ | $\$ 800$ | $\$ 750$ | $\$ 455$ |

Costs are based on 16' height including craneways and supporting columns. Costs are for length of craneway. Add or subtract $5.5 \%$ for each 2' of variance from base ht. Example: 100 LF of 18 " craneway beams with supporting columns 25 'oc, 20 ' high = $\$ 480+(2 \times 5.5 \% \times \$ 480)=\$ 532.80 ; 100$ LF at $\$ 532.80=\$ 53,280$ craneway cost.
